Development of the Number of Survey Respondents

Gender and Mother Tongue

The proportion of women has remained the same every year. There should be more men among the respondents. There is reason to suspect that the sample does not adequately represent the men from Vaasa.

Age

Mean age: 2023: 46,0 years, 2022: 46,2 years, 2021: 42,5 years

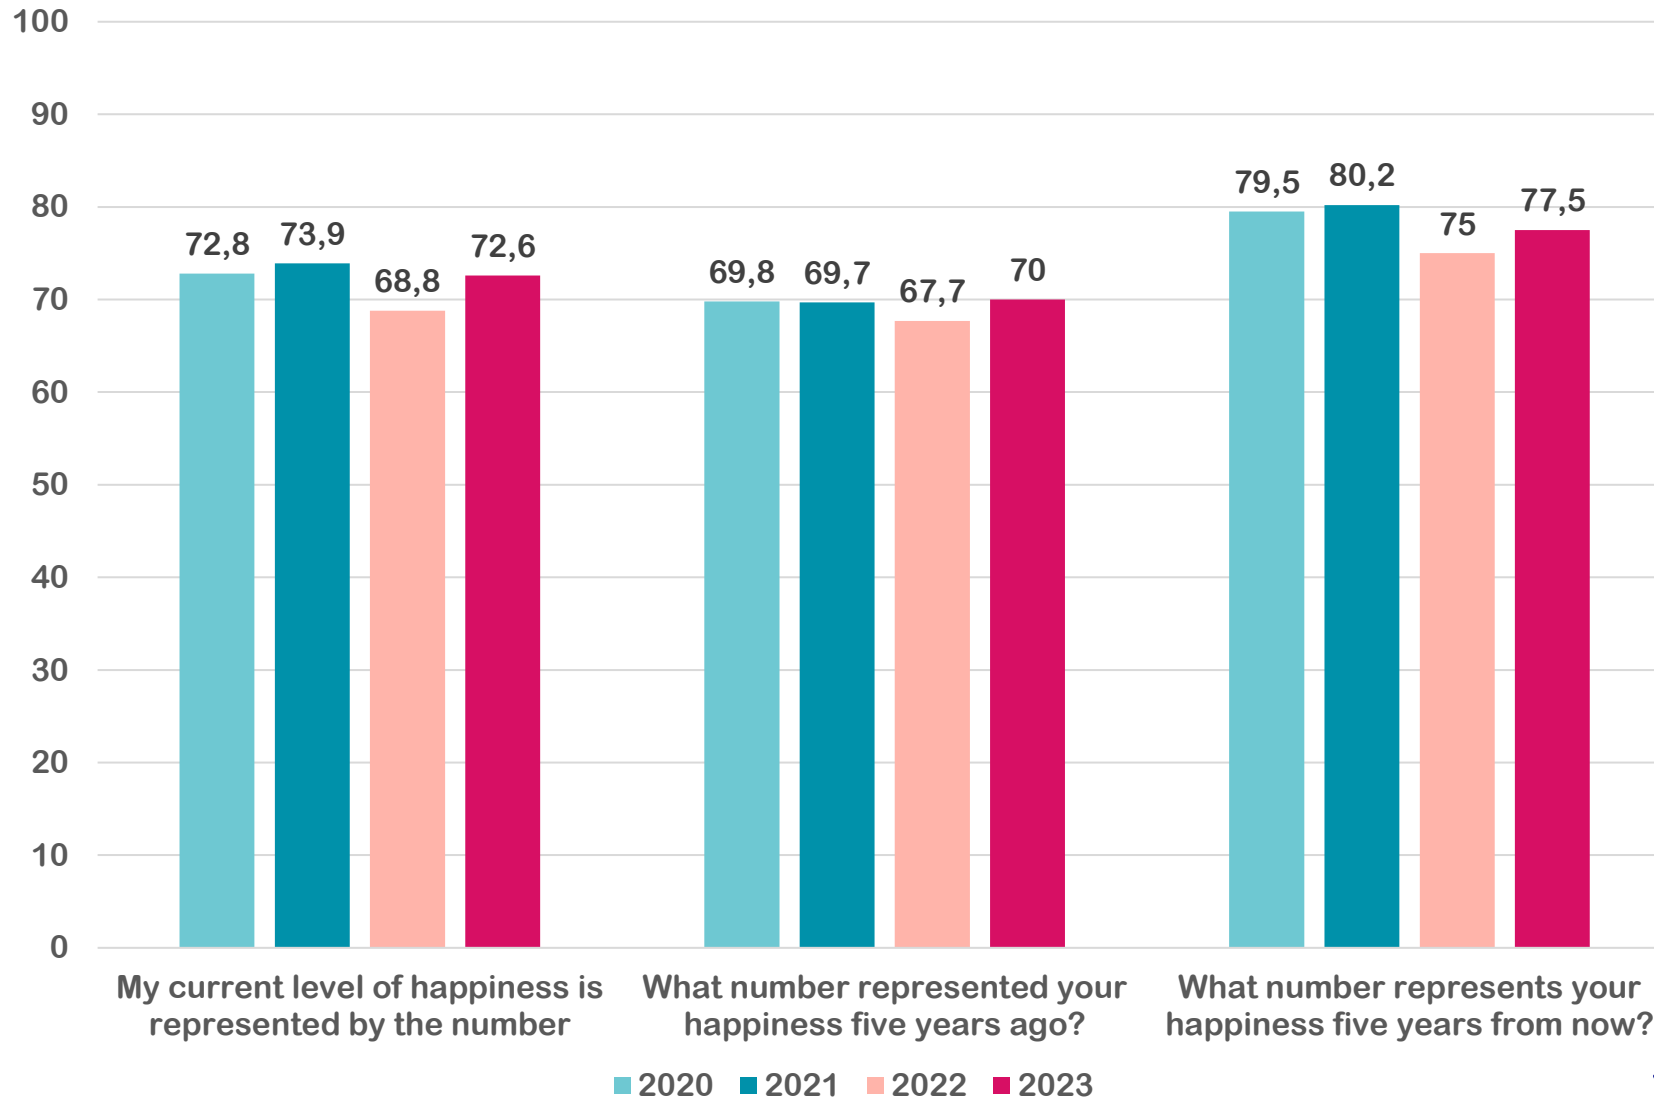

The age distribution is moderately even, although there could have been more young respondents. The proportion of the oldest age groups has been slightly larger in the last two years compared to the previous two years.

V ^ ^ S ^ .
V ^ S ^ .

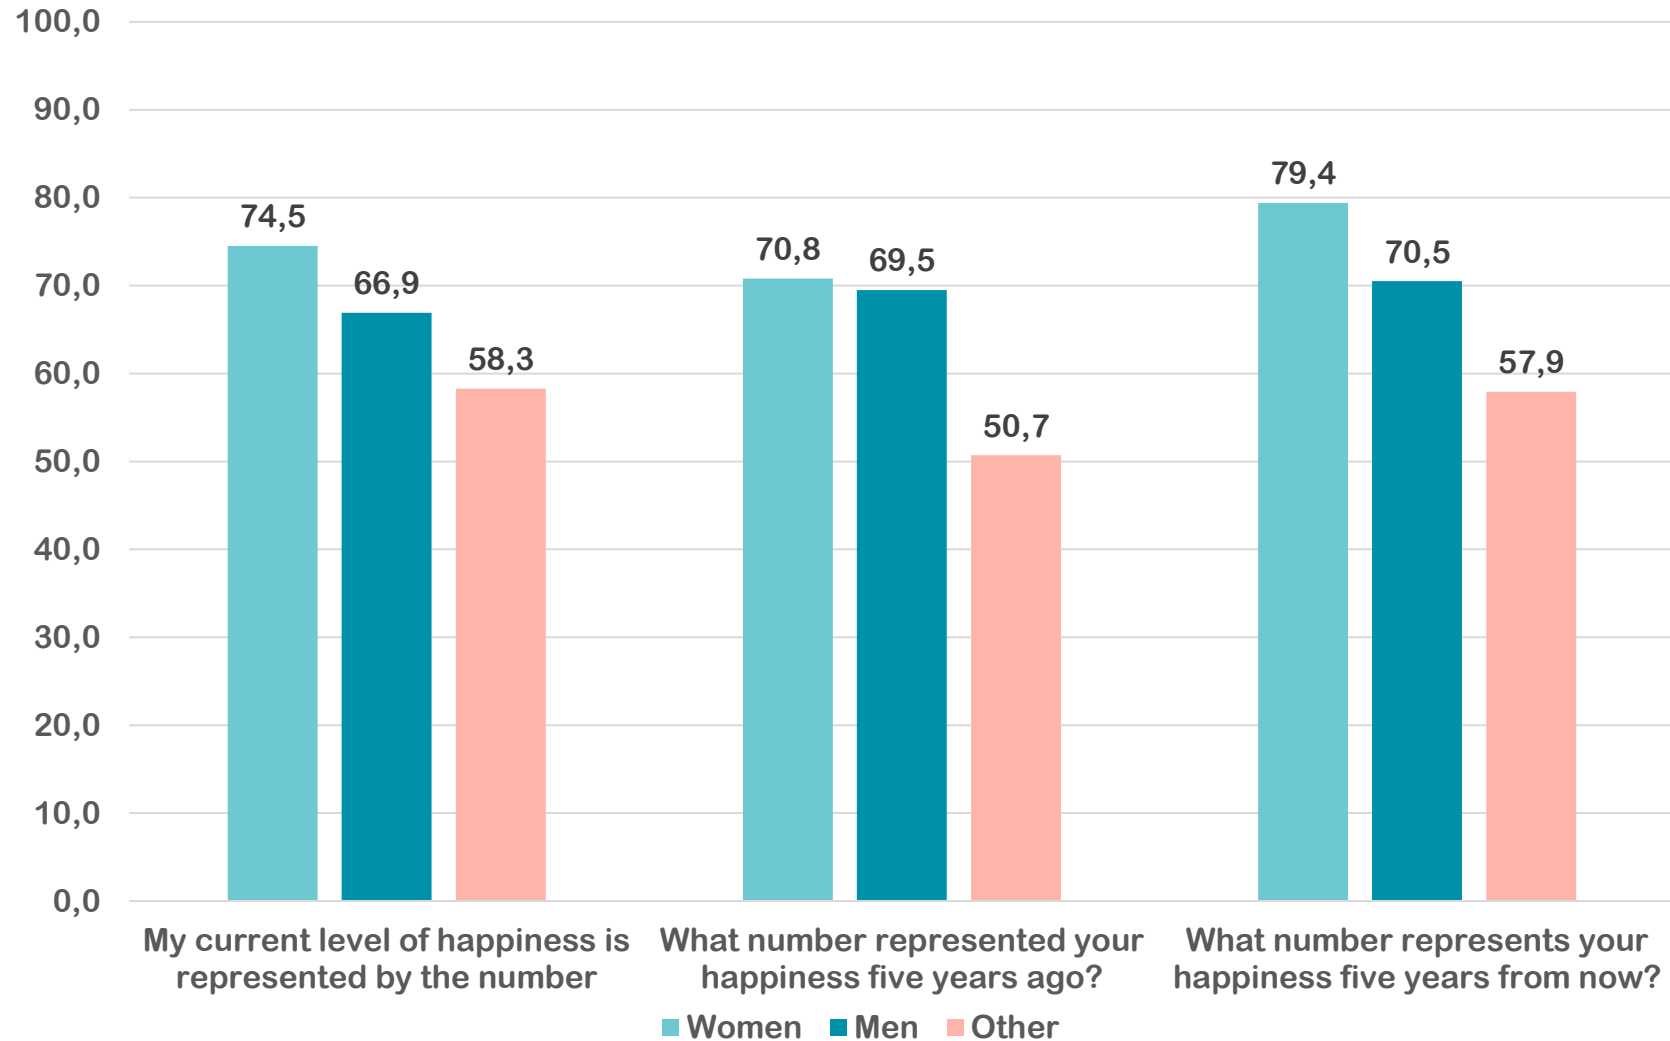

Results

Happiness

Happiness by Gender

The results for men are surprising: their current happiness is notably lower than that of women. However, the future looks better for both men and women. It is unusual that men were happier five years ago than they are now. Due to small group sizes (5+14) in the "Other" group, I combined the options "Other" and "I prefer not to disclose" into one group. Of these two, assessments from the "I prefer not to disclose" group were more negative than those from the "Other" group alone. The ratings were noticeably lower than those in the men's and women's group. I am fairly certain that the group of men is selective.

Distribution of Happiness

Satisfaction with Different Aspects of Life

2020 2021 2022 2023

Correlations of Satisfaction Factors with Happiness 2023

Marriage/Relationship	.43
Leisure time	.55
Friendships	.50
Living environment	.62
Livelihood	.56
Work or studies	.49
Health	.56
Housing	.59

- Satisfaction ratings correlate strongly with each other. In these studies, there is always a halo effect present (in all studies, not just this one). This means that assessments are very comprehensive. When things are going well, they tend to be rated positively across the board; when things are going poorly, they tend to be rated negatively across the board. Causal relationships cannot be inferred from these results because the measurements were taken at the same time. Either satisfaction is assessed positively, leading to happiness, or happiness leads to positive assessments of satisfaction factors.
- Correlation of the marriage/relationship scale is lower than others. The correlations of this variable are surprisingly lower compared to other quality scales. This suggests that it may be its own separate source of satisfaction.

Correlations of Wellbeing Variables with Happiness 2023

Hopefulness	.72
Love	.54
Experience of appreciation	.68
Safety	.59
Challenges in life	.34
Self-acceptance	.54
Life management	.59
Meaningfulness of life	.71
Fairness of life	.65
Mental balance	.60

- Happy individuals experience all these wellbeing components.
- The exception is experiencing challenges because it is not as strongly related to happiness as the others. Whether there are few or many challenges, it does not have a significant impact on the experience of happiness.
- The highest correlations were found with **hopefulness, meaningfulness, and appreciation**. These factors have also shown a strong association with happiness in international studies.

Correlations of Happiness with Service Ratings 2023

Education services	.54
Day care services	.52
Transport services	.36
Employment services	.49
Environmental management	.45
Cultural services	.46
Vaasa’s cleanliness	.42
Sports and outdoor services	.49
Vaasa’s climate goals	.40
Vaasa’s administration	.49
Equal treatment	.55
Promotion of safety	.53
Vaasa’s future	.52
Vaasa’s public image	.49
Community spirit in Vaasa	.48

These correlations likely reflect more a person’s **level of happiness** than the effects of services on happiness. Happiness is to such an extent a result of genetic factors and the immediate environment that only truly poor services affect happiness. That is not the case in Vaasa.

It must be remembered that **not everyone has used the services**. The number of “I don’t know” responses varies greatly. Almost everyone responds to questions about cleanliness, health (except in 2023), attractions, public image, and sports and outdoor services. Day care services only concern families with children, but apparently many have still responded even though they do not currently have children.

It is difficult to assess the subjectivity (perceptions) of service evaluations. One can hypothesize that a high correlation with happiness indicates that one’s own mood has influenced the evaluation. However, the correlations were very similar.

Variable Sets

Satisfaction is the average of eight aspects of life, and wellbeing is the average of ten wellbeing factors. It is surprising how similar results these three ways of asking provide. The somewhat weaker results in 2022 remain mysterious, although the mortality from COVID-19 was higher that year than in the previous two years. The war in Ukraine may also have had an impact.

■ 2020 ■ 2021 ■ 2022 ■ 2023

V ^ ^ S ^ .
V ^ S ^ .

Variable Sets

Let us now take a look at four key assessments over these four years. I chose livelihood, health, safety, and hopefulness. These may explain the drop in 2022. The first wave of COVID-19 began in February 2020. The war in Ukraine began on February 24, 2022.

The drops in safety and livelihood from 2021 to 2022 were quite significant, so it is possible that the combination of the coronavirus and the war in Ukraine led to this negative change. Another explanation could be the selection of individuals expressing negative assessments in the sample. This hypothesis can be tested by looking at how some services were evaluated in 2022.

	Livelihood	Health	Safety	Hopefulness
2020	64,7	73,1	78,1	73,3
2021	66,3	73	80,3	74,8
2022	60,4	70	74,5	70,1
2023	63,6	71,9	76,6	73,6

■ 2020 ■ 2021 ■ 2022 ■ 2023

Variable Sets

Assessments of health and social services deteriorated significantly from 2021 to 2022. Assessments of Vaasa's administration also declined significantly. If the 2022 sample has more critical respondents compared to other years, one would expect this to be reflected in cultural services and public image as well. However, the drop in these areas was significantly smaller compared to previous years. Thus, there is some support for the idea of a higher proportion of critical respondents in the 2022 sample, but the strongest criticism was directed towards health and social services. COVID-19 supposedly burdened health and social services in the previous two years, which then became evident in 2022. Additionally, changes in the system produced uncertainty – and not just in Vaasa.

Do you have any effective methods that you use when you're feeling down and in need of cheering up? What methods do you use then? ²³

What Do The Assessments Tell Us?

How can the results be interpreted and
how reliable are the assessments?

Life Management and Belief in the Future

There were several questions about these.

1. Happiness is more in one's own hands than dependent on external factors.
2. The majority have achieved what they have aimed for (almost completely or completely).
3. The majority believe their own life is heading in a better direction.
4. Happiness five years from now is projected to be significantly higher than it is currently.
5. Ratings for hopefulness are high (2023: 74/100).

Activity

About one-third are active helpers and participants, and the same number are passive. There is a positive perception of exercise: approx. 60% exercise several times a week. Perhaps this has been slightly overestimated? $\vee \wedge \wedge S \wedge .$

$\vee \wedge S \wedge .$

Means to Happiness

Many things have support. Advice is not necessarily followed, yet guides and instructions are read and listened to. Why is this done?

Neither a simple life nor chasing after money interest people. The most important thing is to understand the significance of small things and to maintain a positive mindset. For many, even pleasures are important. There are also supporters of tranquillity of mind and adhering to virtues.

Happiness Thieves

On average, residents of Vaasa had 2,3 happiness thieves in 2023. The most significant ones were pains and aches, excessive sensitivity, and pressure for efficiency. There were also plenty of other thieves.

- The only exception was excessive alcohol consumption (5%), which seems quite small. However, half a million Finns drink so much that it poses a health risk. Perhaps they are not among the respondents, though.

Shyness and sensitivity are problems for many.

Persistent financial difficulties lower happiness the most. Also, injustices experienced in adulthood lower happiness.

V A A S A .
V A S A .

What Kinds of Things Lower Happiness in 2023?

1.	Unemployment	46,8
2.	Financial difficulties	63,3
3.	Studies	64,0
4.	Age 15–24	64,1
5.	5+ happiness thieves	65,0
6.	Injustices in adulthood	66,7
7.	Male	66,9
8.	Childhood insecurity	67,8
9.	Violence from a loved one	68,0

What To Pay Attention To (1/3)

- Happiness has rebounded from the slump in 2022 to a good level (72,6/100).
- Happiness is still very much dependent on oneself (43%).
- The sense of security remains high (77/100). Differences between age groups are quite small. The exception is the age group of 55–64-year-olds (74/100).
- Volunteering and exercise have slightly increased after the pandemic.
- The means to happiness are very similar every year. It is clear what people find useful. The most popular has been “Understanding that happiness is about very small moments of joy that come when they come”. This attitude may explain Finland’s top position in international comparisons. It is a very modest assessment of what happiness is about.
- The worst happiness thieves have been pains and aches, excessive sensitivity, and pressure for efficiency in all four years. The fewest responses concern excessive alcohol consumption. Persistent financial difficulties have increased in 2022 and 2023 compared to the previous two years.

What To Pay Attention To (2/3)

- Regarding happiness thieves, the factors that most significantly lower happiness are persistent financial difficulties, injustices experienced in adulthood, childhood insecurity, violence from a loved one, and excessive shyness. A small surprise is that their impact is not very significant. An even bigger surprise is that pains and aches, excessive alcohol consumption, and significant losses do not reduce happiness. The last-mentioned issue, however, may not be as current as the other two. Regarding a loved one's death, the majority recover well over time. Regarding alcohol, a somewhat cynical thought comes to mind: "I drink too much, and yet everything is fine!"
- Excessive sensitivity has been prevalent in all research years, but it has not affected happiness ratings. Pressure for efficiency is also commonly complained about, but the happiness of those who have highlighted this aspect is roughly the same as others.
- Increase in the number of happiness thieves reduces happiness, but only when four of them are mentioned. This may indicate people's ability to adapt to their problems. After all, illness and problem statistics speak volumes; according to studies, every other Finn has some serious illness or problem.
- The decline in service ratings in 2022 has almost returned to the level of 2021.

V ^ ^ S ^ .
V ^ S ^ .

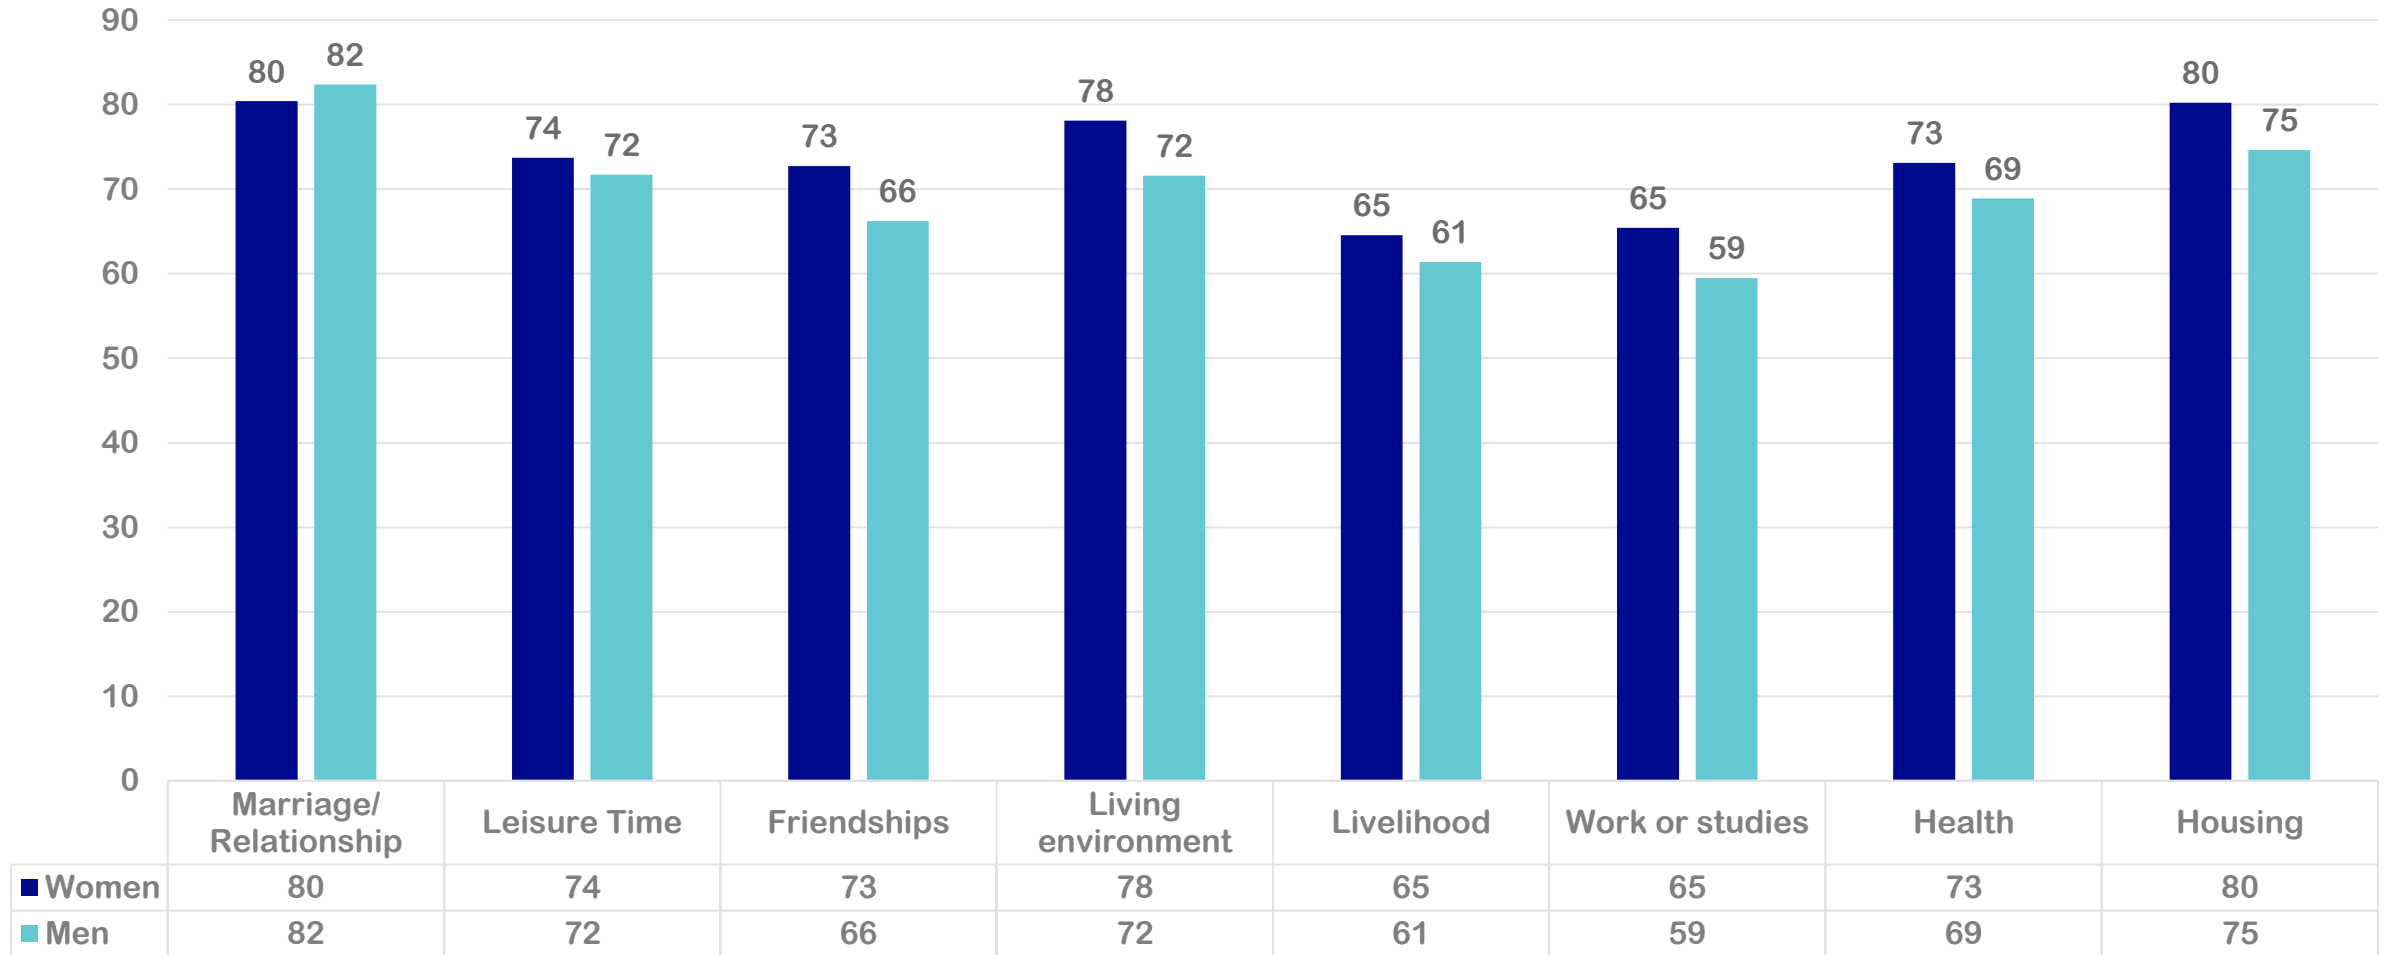

What To Pay Attention To (3/3)

- A person living outside the City of Vaasa is puzzled by the ratings given to attractions in all the happiness surveys. From an outsider's perspective, better ratings could be given to this aspect. Perhaps the residents of Vaasa have become accustomed to them.
- The halo effect may also be indicated by the fact that the correlations between happiness and services are quite high. When one is happy, the services also seem good. Of course, the effect can also go the other way around, from services to happiness. The correlation of fair treatment to happiness is the highest (.55).
- The assessment of the City of Vaasa's future once again leans quite clearly towards a positive direction (50%; 32% negative).
- Pessimism regarding one's own life has still slightly increased since 2022. Nevertheless, there were 51% optimists among the respondents. This is one of the few questions where respondents' ratings are more negative when comparing 2022 and 2023. It may involve burdens from previous years.
- Still, it is surprising how many believe they have achieved what they have aimed for in life. In 2023, 51% of respondents answered that they have achieved what they have aimed for in life "almost completely" or "completely".

Summary 2023

1. The results are very similar whether the survey inquires about happiness, satisfaction, or wellbeing. Assessments clearly lean towards the positive direction.
2. Among the wellbeing variables, optimism (.72) and meaningfulness (.71) correlate most strongly with happiness.
3. Happiness of the youngest age group remains lower than that of other age groups, as in previous years.
4. Residents of Vaasa are very satisfied with their marriage/relationship (81/100). The quality of housing and living environment is also appreciated (79/100 and 77/100).
5. Ratings for livelihood and work/study are only satisfactory (64/100 and 64/100). This may be explained by the percentage of unemployed individuals (4%), as the happiness of the unemployed was only 47/100. Students rated their work more negatively than those employed. Part-time work also decreased happiness.
6. Those who stay at home to care for children are the happiest (77/100).
7. Despite the war in Ukraine, the average score for security is high among the wellbeing variable (77/100).
8. The effects of COVID-19 are difficult to assess. The employment situation has remained fairly consistent across samples, and there have not been drastic changes in livelihood (with the most negative ratings seen in 2022). The employment situation in Finland has steadily improved over the past four years. Support for businesses facilitated retaining employment.
9. In 2022, ratings for services were negative compared to other years (especially regarding health and social services). In 2023, ratings were again very similar to those in 2020 and 2021. The dip in 2022 could have been due to congestion in health services, which reflected in other assessments as well. Another explanation could be that the respondents included highly critical assessors.
10. There were no differences in happiness between Finnish- and Swedish-speakers.
11. Men's happiness was significantly lower than that of women. This does not align with other Finnish studies, although women's happiness is often higher than men's.
